

# MicroCheck Anilox Roll Analysis Service

Our ReNew™ MicroCheck Anilox Roll Analysis Service is a convenient way to find out if your roll is performing to its full capacity. Simply make an impression of your roll with our unique foil testing strip and send the strip to us for a complete analysis. We will read it using our high-powered digital AniCAM microscope and then send you a report containing volume readings, electronic images of the cells, an interpretation of the readings and a recommendation. The roll can remain in the press throughout the testing and inspection process with little impact on press uptime. Knowing the condition of your roll is the first step in determining the necessary course of action to maximize cell volume and maintain consistent coating film thickness.

- > Includes a detailed report with cell volume readings, cell measurements, photos and a recommendation
- > Eliminates the need for inspection equipment investment
- > Roll can remain in the press during the inspection process
- > Detailed electronic reports allow you to track volume changes and cell wear
- > Report is returned within 24 hours of our receiving the testing strip
